

**In the Specification**

Please amend the paragraph that appears on page 3, lines 26-32, as follows:

The device may be a mobile telephone, smart phone, communicator, laptop computer, PDA, dedicated web terminal or similar. These devices will typically operate over wide area wireless networks such as GSM, UMTS, CDMA etc. cellular networks. The device may optionally also (or alternatively) connect to the origin web server using (at least in part) a local area wireless network, such as ~~902.11~~ 802.11 or Bluetooth wireless networks. In one implementation, the log is generated at the device and replicated to the remote computer.

Please amend the paragraph that appears on page 6, lines 28-31, as follows:

Another way this system could be implemented with no UI changes of the phone is to set up a set ~~[[a]]~~ of locally cached menu of services which refer to locally cached pages on the phone – these would either contain the cache content or redirect the users to the external site if the site was not cached.
